

Lab 2: Agile Backlog Creation & Sprint Simulation in Jira
Customizable Subscription Box Scheduler (Problem Statement #35)
SRN: PES1UG24CS525
NAME: VENNELA SHKATHI VP

1. BACKLOG WITH EPICS & USER STORIES (with Story Points)

2. SPRINT BOARD (Active Sprint View)

3. BURNDOWN CHART

REFLECTION QUESTIONS

1. Did your estimations reflect the actual effort?

The relative sizing was reasonable — the fulfillment manifest export (8 points) was rightly treated as the most complex story since it involves aggregating data across all active subscriptions and generating shipping labels, while simpler UI-focused stories like managing preference tags (3 points) were scoped lower. Since this was a simulated sprint rather than actual development, real implementation effort wasn't measured against the estimate, but the relative ranking between stories held up logically.

2. Was your backlog well-prioritized?

Yes. Priority levels followed directly from the original requirements table. Core subscriber actions — swapping box items and pausing/skipping a billing cycle — along with the fulfillment manifest export, were marked High priority since they directly affect revenue and warehouse operations. Supporting features like preference tag management and renewal reminders were

marked Medium since they improve the experience but aren't essential to the core booking/fulfillment flow.

3. How did your simulated sprint align with your plan?

The plan was to split the 5 user stories across two sprints. In practice, Sprint 1 absorbed most of the higher-priority items and they were completed quickly, while Sprint 2 picked up the two remaining stories. This reflects a common real-world pattern: teams often front-load higher-priority or better-understood work early, which can leave later sprints lighter than originally planned.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart showed a sharp, near-vertical drop in remaining story points rather than a gradual decline against the guideline line. In an actual sprint, this pattern could indicate the team is finishing work much faster than planned, suggesting under-commitment during sprint planning. In this simulated exercise, it reflects that all stories were marked Done in a single batch rather than progressively throughout the week — a useful reminder that burndown charts are only meaningful when status updates happen incrementally over the sprint duration, not all at once.
